

#### ABSTRACT OF THE DISCLOSURE

A skate board rack has a raised portion for supporting a side of a skate board. Preferably, the raised portion includes an opening or slot large enough to accept an edge of a skate board platform but small enough that the width of the skate board platform does not fit in the opening. The rack can support one or more skate boards, and can be used to raise the skate boards from or above a walkway to reduce the possibility of people stepping on the skate board or its wheels. Board locks or truck locks may be used to secure skate boards, and can be used to secure skate boards that are supported by a skate board rack.
